

AI Features Specification

Student OS Documentation — File 13

AI Architecture

Keep AI provider logic behind a service abstraction. The application should be able to switch models/providers without changing the core UI or database design.

AI Study Planner

Input: exams, tasks, subjects, deadlines, available study windows and optional preferences. Output: proposed schedule with reasoning. User must be able to edit/accept it.

AI Doubt Assistant

Input: student question and optional context. Output: simple explanation, examples and next steps. Avoid presenting uncertain information as fact.

AI Notes Summary

Input: user-selected note/content/file. Output: summary, key points and optional questions.

AI Exam Preparation

Input: exam details and user-provided syllabus/notes. Output: revision plan, practice questions and checklist.

AI Performance Analysis

Input: valid application metrics. Output: trends and actionable observations. Do not diagnose or invent causes.

Guardrails

Never fabricate official dates, attendance, marks, faculty or institutional announcements.

Clearly label AI-generated content.

Allow users to inspect/edit generated plans.

Handle provider errors, timeouts and unavailable models gracefully.

Protect API keys and sensitive data.

Prompt/Data Policy

Use structured prompts and validated application data. Avoid sending unrelated user data. Store AI output only when there is a clear product reason.
