

# Student OS — Project README

## Student OS Documentation — File README

### Overview

Student OS is a student-focused academic productivity platform designed to connect timetable, daily planning, tasks, calendar, attendance, exams, notes, notifications and analytics.

### Core Value

The application turns scattered academic information into one actionable workflow: Today → Pending → Upcoming → Next Action.

### Technology

Use the approved architecture and dependency policy documented in the project documentation.

### Documentation Order

01\_PRD → 02\_SRS → 03\_Product Architecture → 04\_UI/UX → 05\_Design System → 06\_Feature Spec → 07\_User Flows → 08\_Database → 09\_API → 10\_Security → 11\_Analytics → 12\_Notifications → 13\_AI → 14\_Testing → 15\_Deployment → 16\_Roadmap → 17\_Open Source.

### Development Rule

Read the relevant documentation before implementing a module. Keep code, tests and documentation synchronized.

### Local Setup

Install dependencies → configure environment variables → start database/services → run migrations/seed data → start frontend/backend → verify health and login flow. Exact commands should be maintained in the final repository setup section.

### Important

Initial data may be demo/manual/authorized integration data. Never scrape or bypass a college system.

### Contribution

Use feature branches, meaningful commits, code review where applicable, tests for important behavior and documentation updates for requirement changes.
